

Science V12/S1 - Fruit Seeds

There are many types of fruit, like apples and grapes. Fruits can be very different. They can be different colors and sizes. Some fruits grow on trees. Some fruits grow on the ground. Watermelons grow on the ground.

Something all fruits have is seeds. Some fruits have one seed. Other fruits have many seeds. A peach pit is one seed. If you look at a strawberry, you can see many seeds. Strawberries are special because their seeds are on the outside.

Fruits use seeds to make new plants. When seeds fall to the ground, they can grow. They grow in soil or dirt. Water and light from the sun help the seed to start growing. One day, the seed will grow up and make more fruit.
